

Business Insights Summary

AdventureWorks Sales Analysis - Prepared for Director Review

This summary pulls together the headline findings from our Power BI sales report. It's meant to give a quick, numbers-backed read on where the business is performing well, where it's struggling, and what's worth a closer look next.

Key Findings

1. Bikes carry the business - but they're slipping.

Bikes brought in ₹9.46 crore of our ₹10.98 crore in total sales - roughly 86% of everything we sold. That same category is down 58.33% year-over-year, which is the single biggest risk on this dashboard. When a category this dominant slows down, it drags the whole number with it.

2. Accessories are small, but it's the only category actually growing.

Accessories generated just ₹12.72 lakh in sales - the smallest of the four categories - but it's the only one with positive year-over-year growth, up 191.60%. Whatever is working here (new products, pricing, marketing) is worth understanding, because none of the other categories are seeing anything close to this.

3. Components had the steepest decline of any category.

Components fell 63.92% year-over-year, the sharpest drop in the report, despite being our second-largest category at ₹1.18 crore. Combined with the Bikes decline, two of our biggest revenue drivers are both moving in the wrong direction.

4. Southwest outsells our weakest region by roughly 3.5x.

Southwest leads all regions at ₹2.42 crore in sales. Northeast, our lowest-performing region, brought in ₹69.4 lakh - about a third of Southwest's total. That's a wide enough gap that it's worth asking whether it's a demand issue or an execution issue.

5. Gold-tier customers punch above their weight.

Gold-segment customers account for a noticeably larger share of total sales (₹8.05 crore) than Bronze customers (roughly ₹50M), even though our Top 20 customer list is made up entirely of Bronze-tier names. That's a bit of a contradiction worth digging into - it suggests our biggest individual spenders and our highest-value segment aren't necessarily the same people.

Recommendations

1. Prioritize a root-cause review of the Bikes decline.

Given Bikes is ~86% of revenue, even a modest further slide would hurt the bottom line more than any other category. This should be the first thing investigated - pricing, inventory, competitor activity, or a genuine shift in demand.

2. Study what's driving Accessories' growth and see if it can be repeated.

Accessories is the one bright spot in the category breakdown. Understanding what's behind the 191.60% growth - and whether it can be applied to Clothing or Components - could offset some of the losses elsewhere.

3. Compare Southwest and Northeast side by side before writing Northeast off.

A 3.5x sales gap between two regions is large enough that it's worth checking whether it comes down to strategy, staffing, or marketing spend, rather than assuming Northeast is simply a smaller market.

Worth Investigating With More Data

1. High Value Customer Count currently shows 0.

That's almost certainly a threshold or calculation issue rather than a true absence of high-value customers, and it should be reviewed before this metric is shared more broadly.

2. A significant share of customers have no mapped Country or City.

These show up as "Not Applicable" in the geographic breakdown. Fixing this data gap would make regional comparisons - including the Southwest vs. Northeast finding above - more reliable going forward.
